

1 Introduction

Like the sectional units addressed in Section 1.1, LaTeX assigns serial numbers to many environments or elements of an environment (e.g., table, figure, equation, or `\item` as discussed in the following sections). This default numbering system eliminates the possibility of committing any mistake as may happen in manual numbering.

Moreover, LaTeX allows you to label a numbered item by a unique reference key, which can be used to refer to the item in any part within the same document (unnumbered items, like `\paragraph{}`, cannot be referred to in this way). The labeling and referring of an item are performed through `\label{rkey}` and `\ref{rkey}` respectively, where `rkey` is the assigned unique reference key of the item².

1.1 Sectional Units

In this section, we discuss the use of sectional units in LaTeX.
